...fehlen mir wirklich die Worte

Gerade beim stoebern gefunden

Da haben die doch tatsaechlich versucht mit einem topischen Antioestrogen,haarwuchs bei postmenopausalen Frauen,und Maennern zu induzieren.Grund dafuer war eine von vielen Maeusestudien,in der antiestrogene die Anagenphase induzierten.Also.....da war auch Hoffman bei,und ich wundere mich,das er noch nicht gemerkt hat,das bei Maeusen,ganz andere Estrogenrezeptoren die erste Geige spielen.Jeder haarbiologisch taetige Wissenschaftler weiss ausserdem genau das Estrogen,vor allem dann wenn es fehlt,haarwuchs induziert,und im Umkehrschluss ein Estrogenblocker die AGA dramatisch verstaeckt.

Sehr sehr lustig finde ich den Schlusskommentar

zitat:The reasons for this lack of effect remain unclear.

Die armen Probanden....na ja gluecklicherweise war die Dauer der Studie recht kurz.

Topical fulvestrant solution has no effect on male and postmenopausal female androgenetic alopecia: results from two randomized, proof-of-concept studies.Gassmueller J, Hoffmann R, Webster A.

Bioskin Institute for Dermatological Research and Development GmbH, Poppenbuetteler Bogen 25, 22399 Hamburg, Germany.

Background Androgenetic alopecia (pattern baldness) affects approximately half of all white-skinned men and women over the age of 40 years. Based on preclinical studies in mice in which topical fulvestrant (ICI182,780, an anti-oestrogen) caused telogen hair follicles to enter anagen, thereby causing hair growth, a topical formulation of fulvestrant was developed for the potential treatment of androgenetic alopecia. Objectives To evaluate the efficacy of fulvestrant solution in stimulating hair growth in men and postmenopausal women with androgenetic alopecia in two randomized, phase II, minoxidil- and/or vehicle-controlled studies. Methods One hundred

and two white-skinned men aged 18-50 years with Norwood/Hamilton grades III, IIIv, IV, V or Va androgenetic alopecia received topical fulvestrant 70 mg mL(-1) solution, vehicle or minoxidil 2% solution twice daily for 16 weeks. Seventy postmenopausal women with Ludwig grade 1 or 2 androgenetic alopecia received topical fulvestrant 70 mg mL(-1) solution or vehicle twice daily for 16 weeks. The endpoints in both studies were hair density, cumulative hair thickness and hair growth rate, measured by TrichoScan analysis of digital images. Results There were no statistically significant differences favouring fulvestrant over vehicle at study end (day 113) for any of the efficacy parameters in men or women. Statistically significant differences in favour of minoxidil over fulvestrant were seen from day 57 onwards for hair density, cumulative hair thickness and hair growth rate in men. Conclusions These results indicate a lack of effect of topical fulvestrant in the treatment of subjects with androgenetic alopecia. The reasons for this lack of effect remain unclear.
