Zitat: Marihuana inhibits dihydrotestosterone binding to the androgen receptor

V Purohit, BS Ahluwalia and RA Vigersky

Marihuana and its constituents delta 9-tetrahydrocannabinol (delta 9- THC) and cannabinal (CBN) were tested for their ability to interact with the androgen receptor in rat prostate cytosol. Smoked marihuana condensate, delta 9-THC, and CBN inhibit specific binding of dihydrotestosterone (DHT) to the androgen receptor with a dissociation constant of the inhibitors (Li) of $2.1-5.8 \times 10^{-7} M$. In addition, other metabolites of delta 9-THC were also androgen antagonists. This data suggests that the anti-androgenic effects associated with marihuana use results, at least in part, from inhibition of androgen action at the receptor level.

klings fast so gut wie fluta, aber keiner spricht darüber
und ja ich weiß dass es schonmal threads darüber gab
