The diagram illustrates a four-step process for using fat stem cells to treat hair loss:

- Harvest**: A small amount of fat (50 - 100cc) is taken from the waist area.
- Separate**: Stem Cells are separated from fat cells.
- Activate**: Your Stem Cells are activated with natural proteins.
- Return**: The activated Stem Cells are injected into the scalp.

**Results**: Rejuvenate and repair hair follicle.

A cross-section diagram of skin layers shows the following layers from top to bottom: New Skin Layer, Epidermis, Dermis, Sweat Gland, Erector Muscle, and Hair. Arrows indicate the injection point into the dermis layer.
