Zitat:Levels of allopregnanolone can also be regulated by 3alpha-HSDs (3alpha-hydroxysteroid dehydrogenase) - enzymes which are identical in function to 5AR, except they convert T back from DHT instead of the other way around. 3alpha-HSDs are responsible for downregulating levels of DHT in the prostate and unusual inhibition of 3alpha-HSD would increase DHT levels, decrease allopregnanolone and incline a male toward impaired GABA functioning, acne, baldness, BHP and prostate cancer. Stimulating 3alpha-HSD might be more effective than 5AR inhibition for treating androgen disorders (although elevated exposure to either progesterone or allopregnanolone can become anxiety-provoking instead of calming; there are gender differences to this effect [PMID 12606703]).

kennt sich jemand da aus? gibt es schon Mittel auf dem Markt die 3alpha-HSD stimulieren?
