Hi,

bezgl. der irreversiblen möglichen Schäden durch die Einnahme von Fin habe ich diese Foundation gefunden:

<http://www.pfsfoundation.org/>

Dort findet sich dieses Zitat bezgl der Einnahme bei jungen Patienten:

Treatment of young subjects is of increasing concern due to accumulating evidence that daily use of oral finasteride has several severe adverse effects... Since finasteride inhibits T conversion into DHT, which is responsible for most androgen activity, it is plausible that prolonged finasteride use in predisposed individuals could simulate the effects of aging in young men. Since some of the effects of androgen inhibition cannot be reversed once local androgen levels are re-established, it is tempting to speculate that patients could still suffer from adverse sexual effects several months or even permanently after finasteride discontinuation.

Was genau will uns das Zitat sagen? V.a. das mit dem aging in young men verstehe ich nicht.

Google Translate machte mich auch nicht schlauer;)

chess
