"mean total hair count increased by 77% in the actively treated group compared with only 3% in the placebo group (p = 0.003). Furthermore, the mean terminal hair count for treated men increased by 169% compared with a more 33% increase for the placebo treated men"

"total hair count increased by 77% in the active group compared to a 3% increase in the placebo group (P = 0.003). The number of non-vellus hairs in a 0.433 cm² area increased by 169% for the active group compared to 33% for the placebo group (P = 0.01). In the active group, 90% of the subjects showed an increase of more than 35% in non-vellus hair count compared with only 33% of the placebo group (P < 0.05), and 60% of the active group had excellent results (100% increase in non-vellus hair count) compared with only 8% of the placebo group (P < 0.05)."

Fenchel ist ein COX-2 Inhibitor (da wären wir wieder bei den Prostagladinen) also vielversprechend;

allerdings hätte ich einiges weggelassen: z.B. Minze (wg. Linalool), möglicherweise auch Kamille; den Rest kenne ich nicht.

Rosmarintinktur ist auch sehr gut, hemmt 5ar.

Beste COX-2 Inhibitoren sind Oregano und Thymian (Substanz: Carvacrol).

je nachdem was man als haare betrachtet vor allem in absolute zahlen

beispiel

mehr haar gesamt (flaum+terminal) von 100 auf 177

nur terminal von 10 auf 26,9

die ausgangszahlen wären schon interessant..

Die Studie sieht ja wirklich gut aus, ist aber schon über 15 Jahre alt - diese Creme wurde doch sicher anschließend vermarktet?
