Hello all!!!

I know these informations are in the german part of the forum but I just thought it might be easier for english speaking people to get informations here!

So if you ordered RU and KB from group-buys you probably noticed they are giving these proportions for mixing:

KB5 reagent: 35 KB concentrate : 60 ETHANOL 96%

KB4 reagent: 32 KB concentrate : 54 ETHANOL 96% : 10 DISTILLED WATER

KB3 reagent: 30 KB concentrate : 47 ETHANOL 96% : 20 DISTILLED WATER

KB2 reagent: 28 KB concentrate : 40 ETHANOL 96% : 30 DISTILLED WATER

Now I am wondering what would be the proportion for people wanting to mix RU at 7%?

Thank you for any help!!!

I continue with two other questions.

In term of penetration in the skin, and in term of stability of RU, do you guys know what is the best vehicle:

- KB and ethanol or;
  
- PG and ethanol or;
  
- biflon and ethanol?

Thank you!
